

ABSTRACT

An apparatus including an open box structure having a top, a first side, a second side, a third side, and a fourth side, an inner chamber bound by the top, first, second, third, and fourth sides, and an opening leading to the inner chamber, is disclosed. The first side may be opposite the second side. The apparatus may include a first strap having a first end attached to the first side of the open box structure and a second end. The first strap may be of sufficient length so that the second end of the first strap can be pulled across the opening of the open box structure and attached to the second side of the open box structure, when the open box structure is fully extended. The first strap and/or a second similar strap may be used to secure the open box structure and freight within the open box structure to a pallet.
